Winsig 4.0 Camping Antenna Usage Guide

The WINSIG 4.0 is an omni-directional dual-polarised antenna which receives UHF/VHF terrestrial television transmissions in both the vertical and horizontal planes. This product has been specifically designed with a flexible mounting system to suit campervans, camper trailers and boats and will fit all 25-28mm diameter antenna masts.

1. Connection of the antenna to your Caravan TV and power supply is shown in the diagram overleaf.
2. Best possible results for signal reception will occur when the flat face of the antenna faces the nearest transmission tower. The Winsig 4.0 Camping antenna will also receive signals from the rear of the antenna, thus its omni-directional design allows for significant error in orientation, without degradation of TV reception. **Note: there are several very handy apps for both Apple and Android phones. These will show you via GPS navigation, in which direction to point your antenna. They are free, and available from the respective application stores.**
3. Don't forget to run the auto tuning function on your television each time you reposition your antenna in a new place. As the antenna receives both vertical and horizontal polarity TV signals, you will not need to know which is being transmitted in a given location. The antenna will work regardless.
4. The electronic signal booster is located inside the plastic shell of the antenna. **Note: the power injector must be connected and the power switched on for the antenna to receive any television signals.**

Warranty

Your Winsig Camping Antenna features a 12 Month Warranty. Please remember to register your product online at
